

An Enhanced Systemic Approach to Safety

Presented by
Offer Grembek, Joy Pasquet, Catalina Vanoli
UC Berkeley SafeTREC

Where does a systemic safety approach fit in?

Reactive  *Proactive*

Where does a systemic safety approach fit in?

Spot approach:

Improvement at a specific location in response to a higher-than-expected crash rate at a site

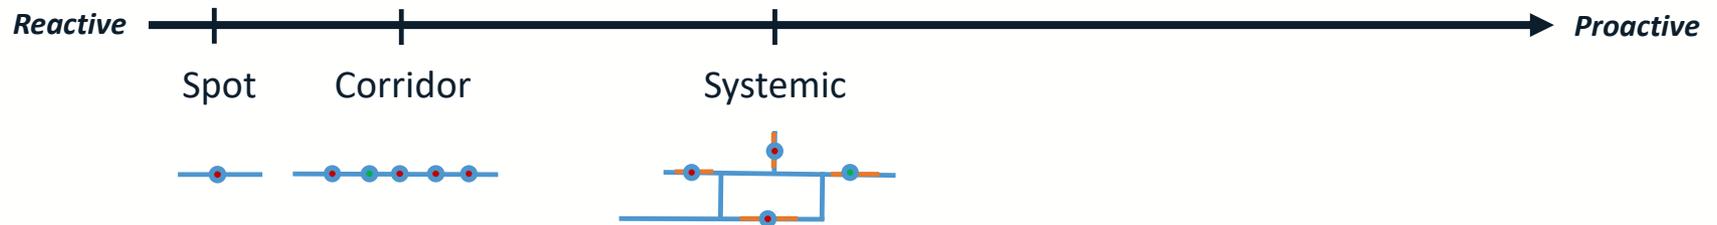

Where does a systemic safety approach fit in?

Corridor approach:

Improvement across a corridor in response to a-higher-than-expected crash rate, or recurring safety concerns along a corridor

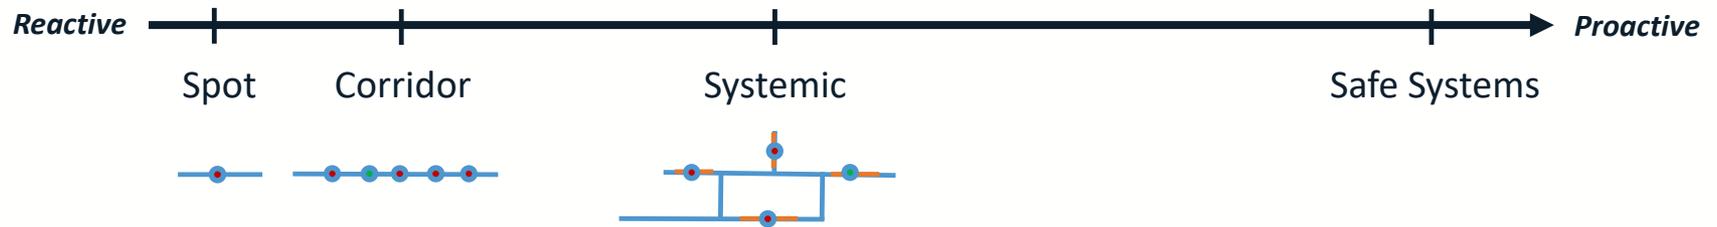

Where does a systemic safety approach fit in?

Systemic approach:

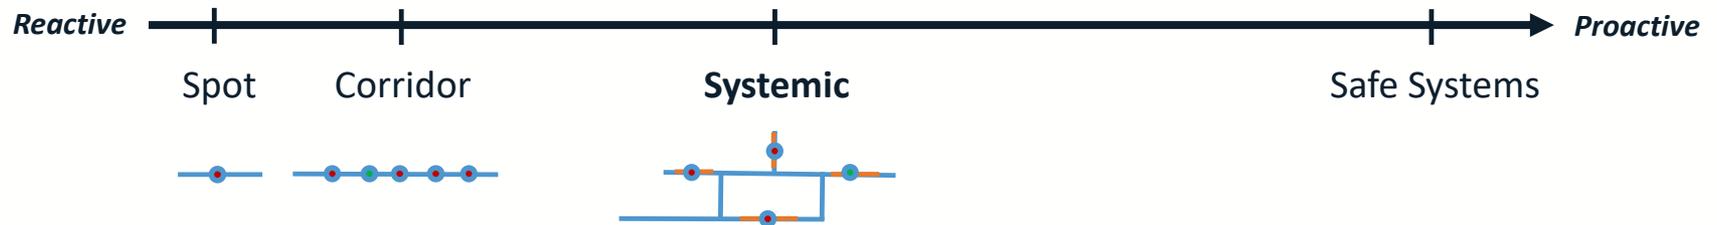

“An improvement that is widely implemented based on high-risk roadway features that are correlated with particular crash types” *FHWA*

Where does a systemic safety approach fit in?

Safe Systems approach:
“Building a system in which people cannot be fatally or severely injured on despite human error” *Soames Job*

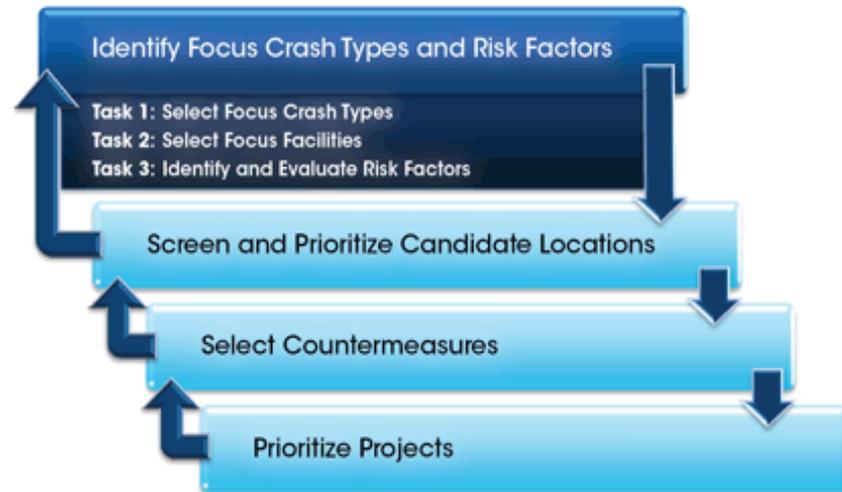

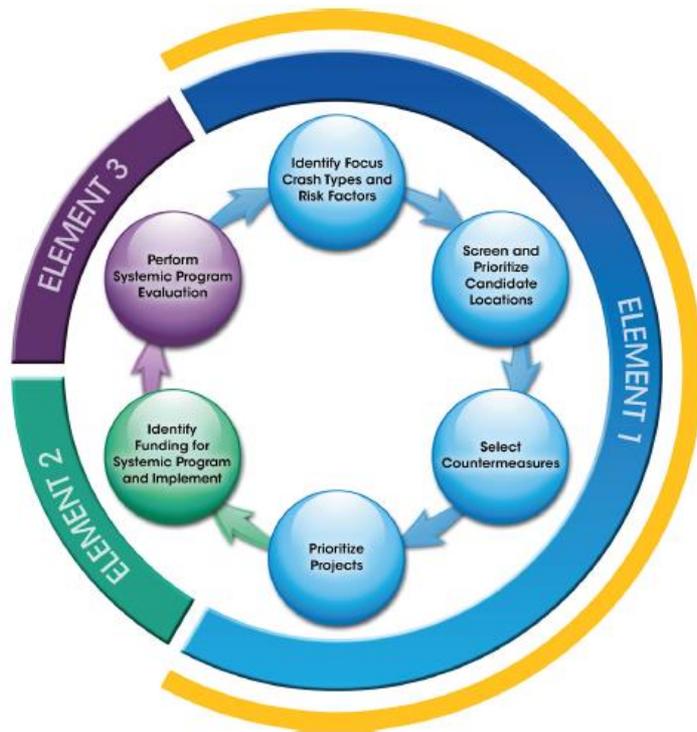

Where does a systemic safety approach fit in?

Systemic approach:

- reactive - it uses historical crash data to identify priorities
- proactive - make improvements also at low or non-crash sites

FHWA's Systemic Safety Program

A systemic matrix approach

Example of a pedestrian safety matrix

Urban and Urbanized, Conventional Highway and City One-Way Street, 2009-2013	Control Type	STEP 2 FILL IN MATR	Unsignalized					STEP 3 MIC					Signalized					Total		
	# of Lanes - Main		<=3		>3			<=3		>3			< 50,000		>= 50,000					
	# of Lanes - Cross		<=3	>3	<=3	>3	<=3	>3	<=3	>3	<=3	>3	< 50,000	>= 50,000	< 50,000	>= 50,000	< 50,000		>= 50,000

* Systemic pedestrian matrix developed by SafeTREC for Caltrans

An Enhanced Systemic Approach to Safety

Three overarching objectives:

1

Enhance methods to identify systemic safety concerns

2

Enhance countermeasure scope to include engineering and non-engineering improvements

3

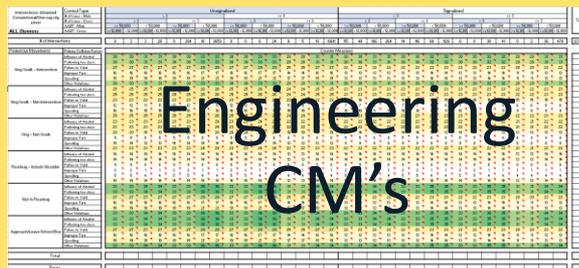

Enhance process to determine high priority locations

Project goals and activities

2

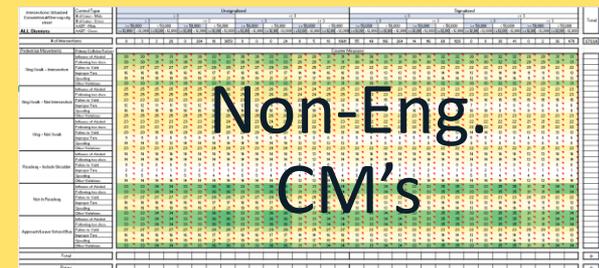

Enhance countermeasure scope to include engineering and non-engineering improvements

develop a list of engineering safety countermeasures to address crash profiles identified for the different matrices

A screenshot of a data table with a grid of colored cells (green, yellow, orange, red) representing data points. The text "Engineering CM's" is overlaid in the center of the grid. The table has a header row with columns for "All Items", "Engineering", and "Non-Engineering". The left side of the table lists various categories such as "Highway - Intersections", "Highway - Median Crossings", "Highway - Med Side", "Parking - Median Crossings", "Park/Parking", and "Apparent/Event/Other".

develop a list of non-engineering improvements to address crash profiles identified for the different matrices

A screenshot of a data table with a grid of colored cells (green, yellow, orange, red) representing data points. The text "Non-Eng. CM's" is overlaid in the center of the grid. The table has a header row with columns for "All Items", "Engineering", and "Non-Engineering". The left side of the table lists various categories such as "Highway - Intersections", "Highway - Median Crossings", "Highway - Med Side", "Parking - Median Crossings", "Park/Parking", and "Apparent/Event/Other".

Enforcement countermeasures

- How can it be used?
 - Police enforcement targeted at the identified problematic facilities
- What is the promise?
 - Filling the gaps in the driving code
- What are the limitations?
 - Burdensome state by state legislative analysis
- Guidelines for future considerations

Education countermeasures

- How can it be used?
 - Elaborating an educational countermeasures matrix
- What are the limitations?
 - Multitude of entities involved in road safety trainings
- What is the promise?
 - Lead the development of learning modules
- Guidelines for future considerations

Data requirements

- Three categories of data
 - Crash data (rows)
 - Roadway data (columns)
 - Operations data (columns or risk)
 - Source: HSIS (Highway Safety Information System) files
 - accident subfile
 - vehicle/occupant subfiles
 - roadway file
 - intersection file
- } Challenge: linking the data

Data collection

HSIS Data for 5 years across 7 states:

- California 2010 - 2014
- North Carolina 2010 - 2014
- Ohio 2011 - 2015
- Washington 2011 - 2015
- Illinois 2006 - 2010
- Minnesota 2006- 2010
- Maine 2011 - 2015

Iterative, data-driven process to determine:

- **ROWS: representation of the crash dynamics**
 - collision factors, violations, collision type, movements, etc.
- **COLUMNS: built-environment conditions**
 - traffic controls, volume, speed, number of lanes, median presence, parking, crosswalk, etc.

Decision-making factors: road safety expertise, share of blank cells, kurtosis, table size, etc.

Considerations for Screening

Trade-offs when setting safety screening priorities:

Inclusive approach	Restrictive approach
Capturing all potential systemic safety challenges	Higher cost-effectiveness
Lower cost-effectiveness	Potentially missing valuable safety-improving opportunities

Summary

- Data-driven methodology to identify recurring safety concerns within a road network, by identifying the crash profiles that are associated with certain roadway features
- Flexible enough to allow agencies with varying degrees of data availability to implement it—regardless of the level of performance their data management systems
- Provide aggregate information on the crashes that occurred to identify systemic hotspots, which then allows to target blanket improvements across an entire facility type.
- Support transition from existing practices in road safety to approaches such as safe systems
